### 3 Introduction

The following document details the Module Interface Specifications for the CVT Simulator-program which is designed for optimizing McMaster Baja vehicles. This document specifies how each module interacts with one another throughout the program.

Complementary documents include the System Requirement Specifications and Module Guide. The full documentation and implementation can be found at <https://github.com/gr812b/CVT-Simulator>.

### 4 Notation

[You should describe your notation. You can use what is below as a starting point. —SS]

The structure of the MIS for modules comes from Hoffman and Strooper (1995), with the addition that template modules have been adapted from Ghezzi et al. (2003). The mathematical notation comes from Chapter 3 of Hoffman and Strooper (1995). For instance, the symbol  $:=$  is used for a multiple assignment statement and conditional rules follow the form  $(c_1 \Rightarrow r_1 | c_2 \Rightarrow r_2 | \dots | c_n \Rightarrow r_n)$ .

The following table summarizes the primitive data types used by CVT Simulator.

Data Type	Notation	Description
character	char	a single symbol or digit
integer	$\mathbb{Z}$	a number without a fractional component in $(-\infty, \infty)$
natural number	$\mathbb{N}$	a number without a fractional component in $[1, \infty)$
real	$\mathbb{R}$	any number in $(-\infty, \infty)$
positive real	$\mathbf{R}_+$	any real number ( $\mathbf{R}$ ) in $(0, \infty)$

The specification of CVT Simulator uses some derived data types: sequences, strings, and tuples. Sequences are lists filled with elements of the same data type. Strings are sequences of characters. Tuples contain a list of values, potentially of different types. In addition, CVT Simulator uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

### 5 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

Level 1	Level 2
Hardware-Hiding Module	
	Engine Simulator Module
	External Forces Module
	CVT Simulation Module
Behaviour-Hiding Module	Input Module
	ODE Solver Module
	Main Module
	Playback Module
	Visualizer Module
	Constants Module
	State Module
	Backend Controller Module
Software Decision Module	GUI Module
	File Output Module
	Communication Module

Table 1: Module Hierarchy

## 6 Engine Simulator Module

[Use labels for cross-referencing —SS]

[You can reference SRS labels, such as R10. —SS]

[It is also possible to use L<sup>A</sup>T<sub>E</sub>X for hyperlinks to external documents. —SS]

### 6.1 Module

Engine Module

### 6.2 Uses

- Constants Module (14)

### 6.3 Syntax

#### 6.3.1 Exported Constants

None

#### 6.3.2 Exported Access Programs

Name	In	Out	Exceptions
getTorque	angularVeloctiy ( $\mathbb{R}$ )	torque ( $\mathbb{R}$ )	-
calcuAngularAccel	angularVeloctiy ( $\mathbb{R}$ ), loadTorque ( $\mathbb{R}$ )	angularAcceleration ( $\mathbb{R}$ )	-

### 6.4 Semantics

#### 6.4.1 State Variables

- Torque curve  $\mathbb{R} \rightarrow \mathbb{R}$
- Inertia  $\mathbb{R}$

#### 6.4.2 Environment Variables

None

#### 6.4.3 Assumptions

- Torque Curve is initialized from the constants module
- Inertia is positive

#### 6.4.4 Access Routine Semantics

getTorque(angularVeloctiy):

- output: torque:= torqueCurve(angularVeloctiy)

calcAngularAccel(angularVeloctiy, loadTorque):

- output: angularAcceleration:= (loadTorque - getTorque(angularVeloctiy))/inertia

#### 6.4.5 Local Functions

None

## 7 External Forces Module

### 7.1 Module

Load Simulator

### 7.2 Uses

- Constants Module ([14](#))

### 7.3 Syntax

#### 7.3.1 Exported Constants

None

#### 7.3.2 Exported Access Programs

Name	In	Out	Exceptions
calcInclineForce	-	inclineForce $\mathbb{F}$	-
calcDragForce	velocity $\mathbb{F}$	dragForce $\mathbb{F}$	-
calcLoadTorque	velocity $\mathbb{F}$	loadTorque $\mathbb{F}$	-
calcGearboxLoad	velocity $\mathbb{F}$	gearboxLoad $\mathbb{F}$	-

### 7.4 Semantics

#### 7.4.1 State Variables

None

#### 7.4.2 Environment Variables

None

#### 7.4.3 Assumptions

Constants are initialized from the constants module

#### 7.4.4 Access Routine Semantics

calcInclineForce():

- output:  $\text{inclineForce} := \text{carMass} * \text{gravity} * \sin(\text{inclineAngle})$

calcDragForce():

- output:  $\text{dragForce} := 0.5 * \text{airDensity} * \text{frontalArea} * \text{dragCoefficient} * \text{velocity}^2$

calcLoadTorque():

- output: loadTorque:= dragForce + inclineForce

calcGearboxLoad():

- output: gearboxLoad:= (loadTorque\*wheelRadius)/gearboxRatio

#### **7.4.5 Local Functions**

None

## 8 MIS of CVT Simulation Module

[Use labels for cross-referencing —SS]

[You can reference SRS labels, such as R10. —SS]

[It is also possible to use L<sup>A</sup>T<sub>E</sub>X for hyperlinks to external documents. —SS]

### 8.1 Module

[Short name for the module —SS]

### 8.2 Uses

- Constants Module (14)

### 8.3 Syntax

#### 8.3.1 Exported Constants

#### 8.3.2 Exported Access Programs

Name	In	Out	Exceptions
[accessProg —SS]	-	-	-

### 8.4 Semantics

#### 8.4.1 State Variables

[Not all modules will have state variables. State variables give the module a memory. —SS]

#### 8.4.2 Environment Variables

[This section is not necessary for all modules. Its purpose is to capture when the module has external interaction with the environment, such as for a device driver, screen interface, keyboard, file, etc. —SS]

#### 8.4.3 Assumptions

[Try to minimize assumptions and anticipate programmer errors via exceptions, but for practical purposes assumptions are sometimes appropriate. —SS]

#### 8.4.4 Access Routine Semantics

[accessProg —SS]():

- transition: [if appropriate —SS]

- output: [if appropriate —SS]
- exception: [if appropriate —SS]

[A module without environment variables or state variables is unlikely to have a state transition. In this case a state transition can only occur if the module is changing the state of another module. —SS]

[Modules rarely have both a transition and an output. In most cases you will have one or the other. —SS]

#### **8.4.5 Local Functions**

[As appropriate —SS] [These functions are for the purpose of specification. They are not necessarily something that is going to be implemented explicitly. Even if they are implemented, they are not exported; they only have local scope. —SS]

## 9 MIS of Input Module

[Use labels for cross-referencing —SS]

[You can reference SRS labels, such as R10. —SS]

[It is also possible to use L<sup>A</sup>T<sub>E</sub>X for hyperlinks to external documents. —SS]

### 9.1 Module

[Short name for the module —SS]

### 9.2 Uses

None.

### 9.3 Syntax

#### 9.3.1 Exported Constants

#### 9.3.2 Exported Access Programs

Name	In	Out	Exceptions
[accessProg —SS]	-	-	-

### 9.4 Semantics

#### 9.4.1 State Variables

[Not all modules will have state variables. State variables give the module a memory. —SS]

#### 9.4.2 Environment Variables

[This section is not necessary for all modules. Its purpose is to capture when the module has external interaction with the environment, such as for a device driver, screen interface, keyboard, file, etc. —SS]

#### 9.4.3 Assumptions

[Try to minimize assumptions and anticipate programmer errors via exceptions, but for practical purposes assumptions are sometimes appropriate. —SS]

#### 9.4.4 Access Routine Semantics

[accessProg —SS]():

- transition: [if appropriate —SS]

- output: [if appropriate —SS]
- exception: [if appropriate —SS]

[A module without environment variables or state variables is unlikely to have a state transition. In this case a state transition can only occur if the module is changing the state of another module. —SS]

[Modules rarely have both a transition and an output. In most cases you will have one or the other. —SS]

#### **9.4.5 Local Functions**

[As appropriate —SS] [These functions are for the purpose of specification. They are not necessarily something that is going to be implemented explicitly. Even if they are implemented, they are not exported; they only have local scope. —SS]

## 10 MIS of ODE Solver Module

### 10.1 Module

ODE Solver

### 10.2 Uses

- Constants Module ([14](#))
- CVT Simulation Module ([8](#))
- External Forces Module ([7](#))
- Engine Simulator Module ([6](#))
- State Module ([15](#))

### 10.3 Syntax

#### 10.3.1 Exported Constants

None

#### 10.3.2 Exported Access Programs

Name	In	Out	Exceptions
solveIvp	list of engineAngularAcceleration $\mathbb{R}$ and carAcceleration $\mathbb{R}$ and carVelocity $\mathbb{S}$ , timeSpan (tuple of $\mathbb{Z}$ and $\mathbb{Z}$ ), array of $\mathbb{S}$ , array of $\mathbb{F}$	list of States (State Module)	-

### 10.4 Semantics

#### 10.4.1 State Variables

None

#### 10.4.2 Environment Variables

None

### **10.4.3 Assumptions**

None

### **10.4.4 Access Routine Semantics**

`solveIVP()`:

- output: `states:= solve_ivp(ode, initial_state, time_span, args)`

### **10.4.5 Local Functions**

None

## 11 MIS of Main Module

### 11.1 Module

Main

### 11.2 Uses

- Communication Module ([19](#))
- Visualizer Module ([13](#))

### 11.3 Syntax

#### 11.3.1 Exported Constants

#### 11.3.2 Exported Access Programs

Name	In	Out	Exceptions
main	-	-	-

### 11.4 Semantics

#### 11.4.1 State Variables

None

#### 11.4.2 Environment Variables

None

#### 11.4.3 Assumptions

The GUI module is assumed to be running in the background and is used to display the results of the simulation.

#### 11.4.4 Access Routine Semantics

main():

- transition: Connects the backend controller module to the visualizer module.

#### 11.4.5 Local Functions

None

## 12 MIS of Playback Module

[Use labels for cross-referencing —SS]

[You can reference SRS labels, such as R10. —SS]

[It is also possible to use L<sup>A</sup>T<sub>E</sub>X for hyperlinks to external documents. —SS]

### 12.1 Module

[Short name for the module —SS]

### 12.2 Uses

None.

### 12.3 Syntax

#### 12.3.1 Exported Constants

#### 12.3.2 Exported Access Programs

Name	In	Out	Exceptions
[accessProg —SS]	-	-	-

### 12.4 Semantics

#### 12.4.1 State Variables

[Not all modules will have state variables. State variables give the module a memory. —SS]

#### 12.4.2 Environment Variables

[This section is not necessary for all modules. Its purpose is to capture when the module has external interaction with the environment, such as for a device driver, screen interface, keyboard, file, etc. —SS]

#### 12.4.3 Assumptions

[Try to minimize assumptions and anticipate programmer errors via exceptions, but for practical purposes assumptions are sometimes appropriate. —SS]

#### 12.4.4 Access Routine Semantics

[accessProg —SS]():

- transition: [if appropriate —SS]

- output: [if appropriate —SS]
- exception: [if appropriate —SS]

[A module without environment variables or state variables is unlikely to have a state transition. In this case a state transition can only occur if the module is changing the state of another module. —SS]

[Modules rarely have both a transition and an output. In most cases you will have one or the other. —SS]

#### **12.4.5 Local Functions**

[As appropriate —SS] [These functions are for the purpose of specification. They are not necessarily something that is going to be implemented explicitly. Even if they are implemented, they are not exported; they only have local scope. —SS]

## 13 MIS of Visualizer Module

[Use labels for cross-referencing —SS]

[You can reference SRS labels, such as R10. —SS]

[It is also possible to use L<sup>A</sup>T<sub>E</sub>X for hyperlinks to external documents. —SS]

### 13.1 Module

[Short name for the module —SS]

### 13.2 Uses

- GUI Module (17)

### 13.3 Syntax

#### 13.3.1 Exported Constants

#### 13.3.2 Exported Access Programs

Name	In	Out	Exceptions
[accessProg —SS]	-	-	-

### 13.4 Semantics

#### 13.4.1 State Variables

[Not all modules will have state variables. State variables give the module a memory. —SS]

#### 13.4.2 Environment Variables

[This section is not necessary for all modules. Its purpose is to capture when the module has external interaction with the environment, such as for a device driver, screen interface, keyboard, file, etc. —SS]

#### 13.4.3 Assumptions

[Try to minimize assumptions and anticipate programmer errors via exceptions, but for practical purposes assumptions are sometimes appropriate. —SS]

#### 13.4.4 Access Routine Semantics

[accessProg —SS]():

- transition: [if appropriate —SS]

- output: [if appropriate —SS]
- exception: [if appropriate —SS]

[A module without environment variables or state variables is unlikely to have a state transition. In this case a state transition can only occur if the module is changing the state of another module. —SS]

[Modules rarely have both a transition and an output. In most cases you will have one or the other. —SS]

#### **13.4.5 Local Functions**

[As appropriate —SS] [These functions are for the purpose of specification. They are not necessarily something that is going to be implemented explicitly. Even if they are implemented, they are not exported; they only have local scope. —SS]

## 14 MIS of Constants Module

### 14.1 Module

Constants

### 14.2 Uses

None.

### 14.3 Syntax

#### 14.3.1 Exported Constants

- **ENGINE\_INERTIA**: A positive real value ( $\mathbb{R}_+$ ) representing the inertia of the current car's engine (in  $\text{kg} \cdot \text{m}^2$ ) used for calculations involving car specifications.
- **GEARBOX\_RATIO**: A positive real value ( $\mathbb{R}_+$ ) representing the current car's gearbox ratio (unitless) used for calculations involving car specifications.
- **FRONTAL\_AREA**: A positive real value ( $\mathbb{R}_+$ ) representing the current car's frontal area (in  $\text{m}^2$ ) used for calculations involving car specifications.
- **DRAG\_COEFFICIENT**: A positive real value ( $\mathbb{R}_+$ ) representing the current car's drag coefficient (unitless) used for calculations involving car specifications.
- **CAR\_WEIGHT**: A positive real value ( $\mathbb{R}_+$ ) representing the current car's weight (in lbs) used for calculations involving car specifications.
- **CAR\_MASS**: A positive real value ( $\mathbb{R}_+$ ) representing the current car's weight converted to kilograms (in kg) used for calculations involving car specifications.
- **WHEEL\_RADIUS**: A positive real value ( $\mathbb{R}_+$ ) representing the current car's wheel radius (in m) used for calculations involving car specifications.
- **AIR\_DENSITY**: A positive real value ( $\mathbb{R}_+$ ), set at 1.225 (in  $\text{kg}/\text{m}^3$ ).
- **GRAVITY**: A positive real value ( $\mathbb{R}_+$ ), set at 9.80665 (in  $\text{m}/\text{s}^2$ ).
- **engineSpecs** A list of dictionaries representing various engine rpm's and corresponding torque values (in  $\text{ft} \cdot \text{lbs}$ ):  
[{"rpm": 2400, "torque": 18.5}, {"rpm": 2600, "torque": 18.1}, {"rpm": 2800, "torque": 17.4}, {"rpm": 3000, "torque": 16.6}, {"rpm": 3200, "torque": 15.4}, {"rpm": 3400, "torque": 14.5}, {"rpm": 3600, "torque": 13.5}]
- **engineData**: A list of dictionary values for angular velocity(in  $\text{rad}/\text{s}$ ), torque(in  $\text{N} \cdot \text{m}$ ), and power(torque\*angular velocity) converting the above **engineSpecs** into SI units.

- **angular\_velocities**: A list of angular velocity values (in rad/s) extracted from **engineData**.
- **torques**: A list of torque values (in N\*m) extracted from **engineData**.
- **powers**: A list of power values (in watts) calculated from **engineData**.
- **torque\_curve**: A cubic interpolation function that maps **angular\_velocities** to **torques**, created using the **interp1d** method with extrapolation for values outside the range.

### 14.3.2 Exported Access Programs

Name	In	Out	Exceptions
<a href="#">[accessProg —SS]</a>	-	-	-

## 14.4 Semantics

### 14.4.1 State Variables

[Not all modules will have state variables. State variables give the module a memory. —SS]

### 14.4.2 Environment Variables

[This section is not necessary for all modules. Its purpose is to capture when the module has external interaction with the environment, such as for a device driver, screen interface, keyboard, file, etc. —SS]

### 14.4.3 Assumptions

[Try to minimize assumptions and anticipate programmer errors via exceptions, but for practical purposes assumptions are sometimes appropriate. —SS]

### 14.4.4 Access Routine Semantics

[\[accessProg —SS\]](#)():

- transition: [\[if appropriate —SS\]](#)
- output: [\[if appropriate —SS\]](#)
- exception: [\[if appropriate —SS\]](#)

[A module without environment variables or state variables is unlikely to have a state transition. In this case a state transition can only occur if the module is changing the state of another module. —SS]

[Modules rarely have both a transition and an output. In most cases you will have one or the other. —SS]

#### **14.4.5 Local Functions**

[As appropriate —SS] [These functions are for the purpose of specification. They are not necessarily something that is going to be implemented explicitly. Even if they are implemented, they are not exported; they only have local scope. —SS]

## 15 MIS of State Module

[Use labels for cross-referencing —SS]

[You can reference SRS labels, such as R10. —SS]

[It is also possible to use L<sup>A</sup>T<sub>E</sub>X for hyperlinks to external documents. —SS]

### 15.1 Module

[Short name for the module —SS]

### 15.2 Uses

None.

### 15.3 Syntax

#### 15.3.1 Exported Constants

#### 15.3.2 Exported Access Programs

Name	In	Out	Exceptions
[accessProg —SS]	-	-	-

### 15.4 Semantics

#### 15.4.1 State Variables

[Not all modules will have state variables. State variables give the module a memory. —SS]

#### 15.4.2 Environment Variables

[This section is not necessary for all modules. Its purpose is to capture when the module has external interaction with the environment, such as for a device driver, screen interface, keyboard, file, etc. —SS]

#### 15.4.3 Assumptions

[Try to minimize assumptions and anticipate programmer errors via exceptions, but for practical purposes assumptions are sometimes appropriate. —SS]

#### 15.4.4 Access Routine Semantics

[accessProg —SS]():

- transition: [if appropriate —SS]

- output: [if appropriate —SS]
- exception: [if appropriate —SS]

[A module without environment variables or state variables is unlikely to have a state transition. In this case a state transition can only occur if the module is changing the state of another module. —SS]

[Modules rarely have both a transition and an output. In most cases you will have one or the other. —SS]

#### **15.4.5 Local Functions**

[As appropriate —SS] [These functions are for the purpose of specification. They are not necessarily something that is going to be implemented explicitly. Even if they are implemented, they are not exported; they only have local scope. —SS]

## 16 MIS of Backend Controller Module

[Use labels for cross-referencing —SS]

[You can reference SRS labels, such as R10. —SS]

[It is also possible to use  $\LaTeX$  for hyperlinks to external documents. —SS]

### 16.1 Module

[Short name for the module —SS]

### 16.2 Uses

- Input Module (9)
- ODE Solver Module (10)

### 16.3 Syntax

#### 16.3.1 Exported Constants

#### 16.3.2 Exported Access Programs

Name	In	Out	Exceptions
<a href="#">[accessProg —SS]</a>	-	-	-

### 16.4 Semantics

#### 16.4.1 State Variables

[Not all modules will have state variables. State variables give the module a memory. —SS]

#### 16.4.2 Environment Variables

[This section is not necessary for all modules. Its purpose is to capture when the module has external interaction with the environment, such as for a device driver, screen interface, keyboard, file, etc. —SS]

#### 16.4.3 Assumptions

[Try to minimize assumptions and anticipate programmer errors via exceptions, but for practical purposes assumptions are sometimes appropriate. —SS]

#### 16.4.4 Access Routine Semantics

[accessProg —SS]():

- transition: [if appropriate —SS]
- output: [if appropriate —SS]
- exception: [if appropriate —SS]

[A module without environment variables or state variables is unlikely to have a state transition. In this case a state transition can only occur if the module is changing the state of another module. —SS]

[Modules rarely have both a transition and an output. In most cases you will have one or the other. —SS]

#### 16.4.5 Local Functions

[As appropriate —SS] [These functions are for the purpose of specification. They are not necessarily something that is going to be implemented explicitly. Even if they are implemented, they are not exported; they only have local scope. —SS]

## 17 MIS of GUI Module

[Use labels for cross-referencing —SS]

[You can reference SRS labels, such as R10. —SS]

[It is also possible to use L<sup>A</sup>T<sub>E</sub>X for hyperlinks to external documents. —SS]

### 17.1 Module

[Short name for the module —SS]

### 17.2 Uses

- Hardware Hiding Module (??)

### 17.3 Syntax

#### 17.3.1 Exported Constants

#### 17.3.2 Exported Access Programs

Name	In	Out	Exceptions
[accessProg —SS]	-	-	-

### 17.4 Semantics

#### 17.4.1 State Variables

[Not all modules will have state variables. State variables give the module a memory. —SS]

#### 17.4.2 Environment Variables

[This section is not necessary for all modules. Its purpose is to capture when the module has external interaction with the environment, such as for a device driver, screen interface, keyboard, file, etc. —SS]

#### 17.4.3 Assumptions

[Try to minimize assumptions and anticipate programmer errors via exceptions, but for practical purposes assumptions are sometimes appropriate. —SS]

#### 17.4.4 Access Routine Semantics

[accessProg —SS]():

- transition: [if appropriate —SS]

- output: [if appropriate —SS]
- exception: [if appropriate —SS]

[A module without environment variables or state variables is unlikely to have a state transition. In this case a state transition can only occur if the module is changing the state of another module. —SS]

[Modules rarely have both a transition and an output. In most cases you will have one or the other. —SS]

#### **17.4.5 Local Functions**

[As appropriate —SS] [These functions are for the purpose of specification. They are not necessarily something that is going to be implemented explicitly. Even if they are implemented, they are not exported; they only have local scope. —SS]

## 18 MIS of File Output Module

### 18.1 Module

output

### 18.2 Uses

None.

### 18.3 Syntax

#### 18.3.1 Exported Constants

None.

#### 18.3.2 Exported Access Programs

Name	In	Out	Exceptions
write	outputPath (String)	-	-

### 18.4 Semantics

#### 18.4.1 State Variables

- states:  $\mathbb{S}^n$ , where each entry represents the state of the car at a given time.

#### 18.4.2 Environment Variables

None.

#### 18.4.3 Assumptions

The file path given can be written to.

#### 18.4.4 Access Routine Semantics

write(outputPath):

- output: Writes the states to a file at the given path.
- exception: [if appropriate —SS]

#### 18.4.5 Local Functions

None.

## 19 MIS of Communication Module

### 19.1 Module

communication

### 19.2 Uses

- Backend Controller Module ([16](#))

### 19.3 Syntax

#### 19.3.1 Exported Constants

None.

#### 19.3.2 Exported Access Programs

Name	In	Out	Exceptions
frontToBack	primWeight $(\mathbf{R}_+)$ , primRampGeo $(\mathbb{R} \rightarrow \mathbb{R})$ , prim- SpringRate $(\mathbf{R}_+)$ , primSpringPre $(\mathbf{R}_+)$ , secHelixGeo $(\mathbb{R} \rightarrow \mathbb{R})$ , secSpringRate $(\mathbf{R}_+)$ , secSpringPre $(\mathbf{R}_+)$ , vehicleWeight $(\mathbf{R}_+)$ , driverWeight $(\mathbf{R}_+)$ , traction $(\mathbf{R}_+)$ , inclin- eAngle $(\mathbf{R}_+)$	primWeight $(\mathbf{R}_+)$ , primRampGeo $(\mathbb{R} \rightarrow \mathbb{R})$ , prim- SpringRate $(\mathbf{R}_+)$ , primSpringPre $(\mathbf{R}_+)$ , secHelixGeo $(\mathbb{R} \rightarrow \mathbb{R})$ , secSpringRate $(\mathbf{R}_+)$ , secSpringPre $(\mathbf{R}_+)$ , vehicleWeight $(\mathbf{R}_+)$ , driverWeight $(\mathbf{R}_+)$ , traction $(\mathbf{R}_+)$ , inclin- eAngle $(\mathbf{R}_+)$	-
backToFront	-	states $(\mathbb{S}^n)$	-

### 19.4 Semantics

#### 19.4.1 State Variables

- mainPath: a String representing the path to the main file.
- outputPath: a String representing the path to the file to be read.

#### 19.4.2 Environment Variables

- pythonPath: a String representing the path to the python environment.

### 19.4.3 Assumptions

All files are in the correct location matching the given paths.

### 19.4.4 Access Routine Semantics

frontToBack(primWeight, primRampGeo, primSpringRate, primSpringPre, secHelixGeo, secSpringRate, secSpringPre, vehicleWeight, driverWeight, traction, inclineAngle):

- transition: Sends the given parameters to the backend controller.
- exception: [if appropriate —SS]

backToFront():

- transition: Reads the states from the output file.
- exception: [if appropriate —SS]

### 19.4.5 Local Functions

None.

## 20 Appendix

[Extra information if required —SS]

## Appendix — Reflection

[Not required for CAS 741 projects —SS]

The information in this section will be used to evaluate the team members on the graduate attribute of Problem Analysis and Design.

The purpose of reflection questions is to give you a chance to assess your own learning and that of your group as a whole, and to find ways to improve in the future. Reflection is an important part of the learning process. Reflection is also an essential component of a successful software development process.

Reflections are most interesting and useful when they're honest, even if the stories they tell are imperfect. You will be marked based on your depth of thought and analysis, and not based on the content of the reflections themselves. Thus, for full marks we encourage you to answer openly and honestly and to avoid simply writing “what you think the evaluator wants to hear.”

Please answer the following questions. Some questions can be answered on the team level, but where appropriate, each team member should write their own response:

1. What went well while writing this deliverable?
2. What pain points did you experience during this deliverable, and how did you resolve them?
3. Which of your design decisions stemmed from speaking to your client(s) or a proxy (e.g. your peers, stakeholders, potential users)? For those that were not, why, and where did they come from?
4. While creating the design doc, what parts of your other documents (e.g. requirements, hazard analysis, etc), if any, needed to be changed, and why?
5. What are the limitations of your solution? Put another way, given unlimited resources, what could you do to make the project better? (LO\_ProbSolutions)
6. Give a brief overview of other design solutions you considered. What are the benefits and tradeoffs of those other designs compared with the chosen design? From all the potential options, why did you select the documented design? (LO\_Explores)
